

Will the broadcast flag interfere with consumers ability to make copies of DTV content for their personal use, either on personal video recorders or removable media?

Will I be able to copy short clips from a complete recording of a program?
If not then I don't want the flag.

Would the digital flag interfere with consumers ability to send DTV content across networks, such as home digital networks connecting digital set top boxes, digital recorders, digital servers and digital display devices?

Will I be able copy the recording to my multiple backup drives?

If not then I don't want the flag.

I want to be able to play my recording at my friends house with out the need to bring my player.

Would the broadcast flag requirement limit consumers ability to use their existing electronic equipment (equipment not built to look for the flag) or make it difficult to use older components with new equipment that is compliant with the broadcast flag standard?

Why do I have to buy new equipment if the old is technically capable?

I don't want hardware limiting encoding.

Would a broadcast flag requirement limit the development of future equipment providing consumers with new options?

Who's going to buy equipment you can't use?

What will be the cost impact, if any, that a broadcast flag requirement would have on consumer electronics equipment?

I refuse to buy equipment or components that lock me out.

Other Comments:

If your recordings are only accessable in your house while your equipment is still operational then the recordings you make for your self have a limited life equal to that of the equipment they are licensed to play on.

I won't buy that.
